

# Vink Rotating cattle brush

## ELASTIC SUSPENSION

- Resistant against animals in heat and mounting each other.
- Adapts itself to the height of any cow by the elastic suspension.
- Also brushes the animal's sides within a reach of 50 cm.

The Vink Rotating Cattlebrush consists of a rotating cylindrical brush, driven by an electric motor in the axle. It is elastically suspended from a truss in the barn. As soon as the cow makes contact with the brush, the motor starts turning clockwise or counterclockwise. Firstly this makes the brushing more effective, secondly it ensures a longer brush life. Because of the elastic suspension and the long brush hairs the animal can never be brushed too forcefully, so damage to the skin or the brush is prevented.

## • THE BRUSH DOES NOT NEED ANY SPACE IN THE BARN

Can be positioned anywhere in the barn.

Is hung from the truss by means of the chains that are supplied with the brush.

## • MOST EFFECTIVE

Because of the large diameter of the brush, the long brush hairs and the elastic suspension, the cow is brushed completely

## • NYLON BRUSH

Nylon is wear-resistant and deforms less than polypropylene

## • SURE

The tail cannot get entangled because the diameter of the brush is larger than the length of the cow's tail. The brush doesn't have parts in which the tail can get jammed. At time of resistance the brush motor will hold.

## • MAINTENANCE FREE

2 years guarantee and 5 years on the nylon brush
